## Where do I start? Prioritizing Invasive Plant Control

By Ellen Jacquart

It's important to think through a plan for managing invasive plants on your land **before** you start the attack. Without a plan, it's easy to underestimate the time and resources it will take to control a species and end up overwhelmed, giving up in frustration. An important part of planning is to prioritize the work ahead of you, deciding what species you should start on first, and where you should attack first. That way, at least you'll know that what you *have* accomplished was more important than what you didn't have time or resources to complete. Here are some helpful hints for prioritizing invasive plant control.

### Prioritizing by species....

You walk through your woodlot and wince when you see the garlic mustard, which looks like it's spread considerably since last year. Then you notice the burning bush shrubs in the understory, and realize your neighbor's landscaping has made itself at home in your woods. And that vine....those orange berries...geeze, where did the Oriental bittersweet come from?!

Like potato chips, it seems nobody can have just one invasive plant species. There are usually multiple species invading a given area, which can make the job of managing a site much more difficult. Where do you start when you have more than one species to deal with? A lot of us have struggled with this, and fortunately there are a few easy rules of thumb to help sort out which species to go after first. ( See Where do I start? Page 2)

## Director Notes

We are pleased again to offer a Fall \$10.00 per tree cost-share for the first 50 trees sold, see Fall Tree Sale page 4-5.

Mark your calendar our Annual Meeting & Dinner will be Wednesday, January 18, 2012.

I also invite you to stop by our office and peruse our library of informational literature. Most are free and include an array of topics from Ag to Urban.

## Email Newsletter

Would you like to receive our newsletter via email instead of regular mail? In these difficult economic times, we are working to reduce our costs, and an e-newsletter is a great way to do so. If you are interested, please call us at the office or send an email to [swcd@swcd.org](mailto:swcd@swcd.org) to submit your request.

## Where do I start?... Cont. from Page 1

What follows is a simplified version of a prioritization template by The Nature Conservancy which can be found at <http://invasive.org/gist/products.html> by clicking on the Weed Management Plan Template. Many other resources on the identification and control of invasive plants can be found on that site.

Before you start prioritizing, though, you need to know three things:

**First, know what you have.** Use a good field guide or a knowledgeable botanist friend to double-check that you've identified a real invasive plant, rather than an innocent look-a-like.

**Second, know how much you have.** The priority you place on 50 plants of garlic mustard will be very different from 5 acres, as you'll see in a moment. Map the invasive plants, circling each area of infestation and estimating what percent within the circled area is invasive species versus native. A handy way to do this is to use Google Earth to zoom in on your property and print out an aerial photo. Draw your property boundary on the aerial, and then walk through your property in a grid-like fashion and mark what you see. Those of you with GPS units and GIS software on your computers are welcome to do it the high-tech way.

**Third, know what you want.** This may be very easy for you, or very difficult. What do you most want to protect on your land? Is it the ovenbirds that nest there? The bluebells that bloom each spring by the creek? The deer habitat? The ability to walk through the woods without having to fight thorny shrubs? Deciding what you want to manage your land **for** is important. Think this through, and even map the areas you most want to protect against invasive plant species.

Now you're ready. The following four questions will tell you which species should be your top priority. You should already know the answers to number one and two from figuring out above how much you have and what you want to protect. Numbers three and four are answered by reading information about each invasive species or talking to professionals who work with invasive species in your area.

For each species, answer these questions and add the points:

**1. How much do you have?**

- 1 pt – I don't have any, but it's near my land
- 2 pts – Just a small amount, but it's spreading
- 3 pts – A fair amount, and it's still spreading
- 4 pts – A LOT! It's covering the whole area completely

**2. What's the value of the habitat being invaded?**

- 1 pt – it's invading my favorite area that has the stuff I want to protect
- 2 pt – it's invading the disturbed edge or areas that I don't care as much about

**3. What impacts is it causing?**

- 1 pt – all is lost; it changes the area so much that few species survive
- 2 pts – it invades undisturbed areas and outcompetes native species
- 3 pts – it doesn't outcompete native species, but natives don't regenerate
- 4 pts – it invades disturbed areas like edges

#### 4. How hard is it to control?

- 1 pt – not too bad, one treatment and it's pretty much gone
- 2 pts – takes multiple treatments, but eventually it's gone and natives replace it
- 3 pts – takes multiple treatments and natives don't come back in readily
- 4 pts – no effective treatment has been found

Now add the total points for each species. ***The lower the score, the higher the priority.***

#### **Prioritizing where to start at a site....**

Alright, you say bravely, the Oriental bittersweet vine is dead and I'm ready to tackle this huge area of garlic mustard. But it's a big project, and I'm not sure where to start. Here are a few more rules of thumb to help prioritize where to work first at a site.

First, identify and map invaded and un-invaded areas as shown in Figure 1. Then follow steps 1 through 4 –

#### **A few last things to keep in mind –**

- If the invasive plant produces bird-dispersed fruits like berries, control the large seed source populations first (which in a forest will usually be along the edge where there is more light), then follow the above rules.
- All roads, trails, and watercourses are invasive corridors; survey them regularly to detect new invaders quickly
- If the invasive species is coming from adjacent land (like, for instance, the garlic mustard in Figure 1 appears to be coming from the land to the southwest), it's time to have a conversation with your neighbors to see if they will also work to control their infestation. I suggest bringing chocolate chip cookies as incentive.
- Keep your focus on what you are managing *for*, not against – just removing invasive plants may not be enough. The unfortunate reality is that invasive plants aren't the only threat to your land. If you love the bluebells that bloom at the creek each year and have worked hard to control the garlic mustard to protect them, keep in mind it's still possible an overpopulation of deer may browse them all away. Don't lose sight of the big picture and other things that impact your land.

Controlling invasive plants can be challenging, but prioritizing your battles before you begin will make your success much more likely. Go get 'em!

	Total Order									

\* indicates what size the tree is available.

**Per Tree Costs Are as Follows**

**1 gallon    \$20**

**3 gallon    \$25**

**5 gallon    \$35**

**7 gallon    \$50**

**10 gallon   \$85**

**15 gallon   \$100**

**Orders are due by:**

**Thursday, October 13, 2011**

\* Note: Johnson County residents may deduct \$10.00 per tree from these prices for cost share. This includes absentee landowners who live in another county, but will be planting their purchased tree(s) in Johnson County. Cost sharing provided by the 2011 Clean Water Indiana Fund Grant.

**Please Note:** All sales are final. Any order not picked up will be given away to a local public facility and no refunds will be issued unless arrangements have been made with the SWCD in advance.
